## Subject Name – Computer Architecture

**Course Type:** - Core

**Course Credits** – 4 Theory

**Course Objectives:** to understanding historical developments, fundamental principles, and advanced concepts in computer architecture and organization. By exploring performance measurement metrics, memory hierarchy optimization, instruction sets, pipeline design, parallel computing, and emerging trends topics, students will develop the knowledge and skills necessary for careers in research, development, and innovation in computer systems design..

**Course Outcomes** – After completion of the course, student will;

**CO1:** Differentiate between computer architecture and organization, and understand their interrelationship..

**CO2:** Able to analyze and evaluate the performance of computer systems using metrics such as throughput, latency, and scalability. Recognize the factors affecting system performance and strategies for optimization

**CO3:** Able to design cost effective memory for a computer system with good performance.

**CO4:** Explore emerging trends and challenges in computer architecture, also the advanced techniques for improving CPU performance, such as pipelining, superscalar execution, and out-of-order execution.

Acquire knowledge of instruction set architecture (ISA) design, including various instruction formats, addressing modes, and how they impact CPU operations.

| 2 | Processor organization         | <p>CPU Structure, Registers, User Visible Registers, General Purpose Registers, accumulator organization, general register organization, stack organization of CPU, High level issues in CPU design</p> <p><b>LO1</b>Evaluate the significance of user-visible registers and general-purpose registers in CPU design, recognizing their roles in executing instructions, managing data, and optimizing performance in various computing tasks.</p>                                                                                                                                                                                                         | 4 | 1,2,3    | Book 2,3<br><br>(Lecture, numerical )   |  | Assign:<br>practice questions                                    |
| 3 | Memory                         | <p>Location, Capacity, Unit of transfer, Access method, Performance (Access, cycle, transfer rate), Physical type (semi conductor or magnetic), Physical characteristics (volatile, erasable etc.), Locality of references, Cache mapping techniques, Cache write policies, Cache initialization, External memory, RAID organization of hard disks.</p> <p><b>LO1:</b> Analyze the characteristics of different memory types,<br/>LO2: Evaluate cache mapping techniques, write policies, and initialization methods, along with RAID organization principles, to design efficient memory hierarchies and improve system performance and reliability..</p> | 6 | 1, 2,3,4 | Book 1,2,3<br><br>(Lecture, numerical ) |  | Assign:<br>practice and assignment questions on cache memory     |
| 4 | Input/Output:                  | <p>Programmed I/O, Interrupt Driven I/O, Direct Memory Access. Representing information digitally, Byte Ordering: Big-Endian &amp; Little-Endian. Instruction sets, Elements of an Instruction, Instruction Representation Instruction types, Number of Addresses, Design Decisions [CISC/RISC], Addressing Modes, Large Register File in RISC. Register and data flow design, data fetch and instruction fetch in indirect instruction cycle.</p> <p><b>.LO1:</b>Differentiate between various techniques of I/O ; Analyze and compare the design decisions in CISC and RISC, and demonstrate various addressing modes with their applications.</p>       | 6 | 1,2,3,4. | Book 1,3<br><br>(Lecture, numerical )   |  | Assign:<br>practice and assignment questions on addressing modes |
| 5 | CPU control unit               | <p>CPU control unit, Functions of Control Unit, Micro-Operations, hardwired implementation, Micro Programmed Control unit, basic concepts, advantages-disadvantages of Micro Programmed and Hardwired control unit</p> <p><b>LO1:</b> Compare the design considerations and trade-offs involved in selecting between micro programmed and hardwired control unit implementations along with the impact of the control unit design on CPU performance.</p>                                                                                                                                                                                                  | 5 | 1,2      | Book 1,2<br><br>(Lecture )              |  | Assignment:c ompare and contrast implementation techniques of CU |
| 6 | Instruction level parallelism: | <p>Pipeline design, Synchronous &amp; Asynchronous Pipeline conflicts: Resource conflict,Data dependency, and Branch difficulties. Solutions to deal with pipelining: Hardware interlocks, operand forwarding, Delayed load, Pre fetch target instruction, Branch target buffer, Loop buffer, Branch prediction, and Delayed branch. Super scalar design; Super pipelining, and VLIW processors.</p> <p><b>LO1:</b> Identify the various types of pipeline conflicts and evaluate solutions to mitigate pipeline conflicts.</p> <p><b>LO2:</b> Analyze advanced techniques like super scalar design, super</p>                                             | 7 | 1,2,4,5. | Book 2,3<br><br>(Lecture, numerical )   |  | Pipeline hazards and overcome techniques and numericals          |

|   |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |   |      |                            |  |                                   |

## Subject Name – Numerical Analysis and Design

**Course Type:** - Core

**Course Credits** – 4 Theory

**Course Objective** – To teach basic numerical methods required for typical engineering and business applications.

**Course Outcomes** –After completion of this course, learners will be able to

- CO1- To make learners aware of basic numerical methods and interpret the results for engineering problems.
- CO2– To understand numerical approximations to the roots of an equation by basic methods.
- CO3– Understand basics of finite differences and learn various interpolation methods.
- CO4- Learner working with numerical integration and differentiation.

**Course Content** –

## Subject Name: Database Management System

Course Type: Core

Course Credits: 4

Course Objectives: To understand concepts of DBMS and build capacity to implement and maintain an efficient database system using emerging trends.

**Course Outcomes** – After completion of the course, student will;

**CO1:**Acquire clarity of the fundamental concepts of DBMS and database models for database analysis and design.

**CO2:** Analyze the real world scenarios and design conceptual and logical database models.

**CO3:**Execute set of queries using SQL and Relational algebra.

**CO4:** Acquire deep knowledge about DBMS to handle and create large database system to manipulate it efficiently

(Q1) | Content and Pedagogy (Q2)                       | (Q3) Online Resources | (Q4) Assign./ Assessment/Discussion                                           |
|---------|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|-----------------------------------|-------------------------------------------------|-----------------------|-------------------------------------------------------------------------------|
| 1       | Introduction to DBMS         | Definition and Purpose of DBMS, Views of data, Three Level Architecture of DBMS, Data independence, Data models- Physical Model, Logical Model, Conceptual Model, Hierarchical Data Model, Network Data Model, Relational Data Model, Object Oriented Model and their comparison.<br><b>LO1:</b> Define DBMS and explain various data models. | 4  | 1 and 2*                          | Book 1 & Book 2<br><br>(Lecture)                |                       | Discussion regarding various DBMSs uses and their applications                |
| 2       | Database Languages and Users | Introduction to Database Languages (DDL, DML, DCL and TCL), Transaction Management, Storage Management, Database Administrator, Database Users, Overall System Structure of DBMS.<br><b>LO1:</b> Classify different database users and describe the types of database languages.                                                              | 4  | 1 and 2                           | Book 2 & Book 3<br><br>(Lecture)                |                       | demonstrate the database concepts studied till now                            |
| 3       | Entity-Relationship Model    | Basic Concepts- Entities, Attributes and Relationship, Mapping Constraint, Keys, Design Issues, Entity-Relationship Diagram, Reduction of an E-R Schema into Relational Models.<br><b>LO1:</b> Analyze and draw ER Diagrams for desired Scenarios to demonstrate the logical representation of database.                                      | 6  | 1, 2, 3 and 4*                    | Book 2 & Book 3<br><br>(Lecture & illustration) |                       | Various exercises for implementing ER concepts                                |
| 4       | Relational Database Design   | Codd's 12 Rules, Pitfalls in Relational-Database Design, Decomposition, Functional Dependencies, Normalization up to 3NF.<br><b>LO1:</b> Normalize the relational database design and apply the integrity constraints.                                                                                                                        | 4  | 1, 2, 3 and 4                     | Book 2 & Book 3<br><br>(Lecture & illustration) |                       | Discussion regarding practical implementation of Codd's Rules & Normalization |

|   |                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                            |    |               |                                                     |  |                          |
|---|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|---------------|-----------------------------------------------------|--|--------------------------|
| 5 | Relational Algebra                            | Introduction to relational Algebra, meaning of tuples, attributes, insertion, deletion, updating and retrieval in relational approach, various operations in relational approach like select, project, join, union.<br><b>LO1:</b> Discuss the significance of Relational Algebra(RA) and write RA queries.                                                                                                                                | 6  | 1, 2,3 and 4* | Book 1, Book 2 & Book 3<br>(Lecture and discussion) |  | Assignment of RA queries |
| 6 | Structured Query Language                     | Table Fundamentals, data types, creating viewing table, inserting, deleting, updating and modifying data in table, Applying data constraints-adding primary key, foreign key, unique key in table. Basic Structure, Set Operations, , Data Definition Language, Data Control Language, Data Transaction Language<br><b>LO1:</b> Write and execute SQL queries for designing and manipulating the database.                                 | 10 | 1 to 5*       | Book 4                                              |  | SQL queries exercises    |
| 7 | SQL Integrity Constraint, Joins and Functions | Integrity Constraint: - Entity Integrity, Referential Integrity and Domain Constraint.<br>Oracle functions-string function,, numeric function, Aggregation Functions, Null Values, Nested Sub Queries, Joined Relation<br><b>LO1:</b> Write and execute complex SQL queries to impose various Integrity Constraints<br><b>LO2:</b> Write and execute complex SQL queries using Joins/Nested queries to retrieve data from multiple tables. | 6  | 1 to 6*       | Book 4<br>(Lecture)                                 |  | SQL practice exercises   |

**\* 1- Remember, 2- Understand, 3- Apply, 4- Analyze, 5- Evaluate, 6- Create**

### **Books and Reading**

#### **BOOKS:**

1. A Silberschatz, H.F Korth, Sudersan “Database System Concepts” , MGH Publication.
2. Modern Database Management (Latest Edition) by Fred R. McFadden, Jeffrey A. Hoffer, Mary B. Prescott
3. Elmasri&Navathe “Fundamentals of Database systems”
4. Ivan Bayross “SQL, PL/SQL the Programming Language of Oracle”.

## Subject Name: System Programming

**Course Type:** Core

Course Credits:4

**Course Objectives:** The course aims to make the students familiar with concepts of systems programming and design of system software.

**Course Outcomes** – After completion of the course, student will be able to:

- CO1: Understand basic concepts of system software and system programming.
- CO2: Learn the design of assemblers, compilers and preprocessors.
- CO3: Understand the structure and design of assembler, compiler, linker and loader.
- CO4: Understand the concept and theory behind the implementation of high level languages.

## Subject Name: Python Programming

Course Type: Core

Course Credits: 4

Course Objectives: To familiarize students with the concepts of Python programming language and to learn various modules of python programming, such as, list, tuple, class, etc.

**Course Outcomes** – After completion of the course, student will be able to;

**CO1:** Able to understand basic concepts, and paradigm of Python Programming

**CO2:** Able to interpret various data structures and programming constructs in the Python language.

**CO3:** Able to identify the significance and implementation of selection, and iteration for solving business problems.

**CO4:** Able to understand the need of object oriented programming concepts, accessing data from files and database, Numpy.

**Course Contents** –

| Unit No | Title                           | Contents                                                                                                                                                                                                                                                                                                                                                                                                                | Hr | Targeted Levels of Blooms T. (Q1) | Content and Pedagogy (Q2)                     | (Q3) Online Resources | (Q4) Assign./ Assessment/ Discussion |
|---------|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|-----------------------------------|-----------------------------------------------|-----------------------|--------------------------------------|
| 1       | Introduction to Python          | How to install Python, Packages, How to install packages, Python variants, How to use python (Command line mode, Scripting Mode), Print Statement, Variables :Values, Types(Boolean, String, Integer, Float ), Variables , benefits of using variables over values, Keywords: Integers, Floats, Booleans, Logical operators,<br><b>LO1:</b> Explain the concept of how to install python, various datatypes, operator.. | 4  | 1 and 2*                          | Book 1.<br><br>(Lecture)                      |                       | Discussion about basics of language. |
| 2       | Control Structure and functions | <b>Control Statements:</b> IF, indentation, IF-Else Statement, Loops: For, While), Continue, Break and Pass, Functions : <b>Functions:</b> def , body, return, Function calling, Nesting of functions, Global Keyword, Default arguments, Docstring, Lambda functions,<br><b>LO1:</b> Understood the various control & loop structures with the help of programming exercises.                                          | 8  | 1, 2 and 3*                       | Book 1 and 2<br>(Lecture, and Program Design) |                       | Develop Program and scripts          |
| 3       | List, Tuple                     | <b>Lists:</b> Notion of list, accessing elements, Slicing and adding, Multiplying a list by integer, copying a list, Operations and functions over list (len, append, count, insert, sort, remove, pop, in), Map and Filter, ), <b>Tuples</b> , packing and unpacking, Functions with multiple return values<br><b>LO1:</b> Explain and develop script with the use of list, tuple and functions.                       | 7  | 1, 2 and 3*                       | Book 1 and 2<br>(Lecture, and Program Design) |                       | Develop Program and scripts          |
| 4       | Dictionary ,Set,                | <b>Dictionaries:</b> Defining and accessing a dictionary<br><b>Sets:</b> Set definitions, Set operations, <b>String:</b> Definition, Formatting, Split, Upper and lowercase functions, Join,<br><b>LO1:</b> Explain and understood the concepts of set, dictionary                                                                                                                                                      | 6  | 1, 2 and 3*                       | Book 1 and 2<br>(Lecture, and Program Design) |                       | Develop Program and scripts          |

|   |                                 |                                                                                                                                                                                                                                                                                                                                                                                              |   |                |                                            |  |                             |
|---|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---|----------------|--------------------------------------------|--|-----------------------------|
| 5 | Module, File I/O                | <b>Modules:</b> Importing a module, Writing user defined modules, overview of common Modules (math, string, random), <b>File input and Output (I/O)</b> :Opening, Reading from and writing to file simple file, reading and writing class object in file<br><b>LO1:</b> Explain and implement the module and file I/O                                                                        | 6 | 1, 2 and 3*    | Book 1 and 2 (Lecture, and Program Design) |  | Develop Program and scripts |
| 6 | Class and Database Connectivity | <b>Classes:</b> Defining and initializing an object, self parameters, class attributes and class hierarchy, Operator Overloading<br><b>Database Connectivity:</b> connect python to MySQL database, execute insert, select, update and delete SQL command by python script.<br><b>LO1:</b> Explain and implement class and database operations by python script                              | 4 | 1, 2 and 3*    | Book 1 and 2 (Lecture, and Program Design) |  | Develop Program and scripts |
| 7 | Numpy and Matplotlib            | <b>Introduction to Numpy:</b> N-dimensional array object, Array broadcasting with scalars, vector operations, Matrix operations, Slicing arrays, Iterating over arrays, Reshaping, Linear Algebra operations<br><b>Introduction to Matplotlib:</b> Plotting library, Scatter plot, Histogram, Boxplot, Imageplot, Wireplot<br><b>LO1:</b> Explain and understood Numpy and Matplotlib module | 5 | 1, 2, 3 and 4* | Book 1 and 2 (Lecture, and Program Design) |  | Develop Program and scripts |

\* 1- Remember, 2- understand, 3- Apply, 4- Analyze
